Why Are These Cases So Challenging?

- Not the same as when many of us started as registrars
- Terminology can be confusing and complicated
- Terms don’t always match up with codes
- What is leukemia/lymphoma?
- Is multiple myeloma a type of leukemia?
- Are some lymphomas also leukemia and vice versa?
- Why are some lymphomas in lymph nodes but not all?
**WHO Definition**

- “B cell and T/NK cell neoplasms are clonal tumors of mature and immature B cells, T cells or natural killer (NK) cells at various stages of differentiation.”

- Cells can be circulating lymphocytes such as lymphoid leukemia or cells in aggregate similar to a solid tumor but tumor made up of all the same type of cells (lymphoma).

- Features of clonality are most often used to identify and establish histologic type for most lymphoid neoplasm.

**Lymphoid Neoplasm Characteristics**

**2013 estimates in the United States**

- 79,030 new lymphoma cases
  - 9,290 Hodgkin Lymphoma
  - 69,740 Non-Hodgkin Lymphoma
- 20,200 lymphoma deaths
  - 1,180 Hodgkin Lymphoma Deaths
  - 19,020 Non-Hodgkin Lymphoma Deaths

**2013 estimates in Florida**

- 5,060 Non-Hodgkin Lymphoma Cases
- 1,450 Non-Hodgkin Lymphoma Deaths

**Lymphoid Neoplasm Characteristics**

**2013 estimates in the United States**

- 15,680 Chronic Lymphocytic Leukemia
  - 4,580 CLL Deaths
- 6,070 Acute Lymphocytic Leukemia
  - 1,430 ALL Deaths

**2013 estimates in Florida**

- 3,490 Leukemia Deaths
  - Lymphoid – CLL and ALL
  - Myeloid – CML and AML

**Common Lymph Node Chains for Lymphoma**

Extra-Nodal Lymphoma

Source: nlm.nih.gov

Common Types of Lymphoma

Source: nlm.nih.gov

Causes and Risk Factors

- Genetic Abnormalities (inherited/acquired)
- Conditions Causing Lowered Immunity
- Chemicals Causing Lowered Immunity
- History of Organ Transplant
- History of Viral or Bacterial Infection
  - HTLV1/HIV/EBV/HHV8/HepC/Helicobacter Pylori
- Auto Immune Condition
  - Rheumatoid Arthritis
  - Systemic Lupus Erythematosus
- Family History of Lymphoma

http://cancer.gov/

Gene Mutation in Familial ALL

- Precursor B cell Acute Lymphoblastic Leukemia (pre-B ALL)
  - The most common malignancy in pediatrics
- PAX5 gene mutation or BSAP – inherited genetic mutation
- Mutated PAX5 present in 30% of pre-B ALL
- Genetic Alteration is 9p deletion with loss of heterozygosity (9p13)
- Identified as harbinger of germline mutation leading to pre-B ALL
- Affected siblings have up to fourfold higher risk for disease
Signs and Symptoms

- Enlarged Lymph Node(s)
  - Neck
  - Armpit
  - Groin
- Swollen Abdomen
- Chest Pain/Pressure
- Shortness of Breath
- Fever
- Weight Loss
- Night Sweats
- Fatigue

Source: b4tea.com

“B” Symptoms

- What is Significance of “B” Symptoms
- What are “B” Symptoms
  - Fevers
  - Night Sweats
  - Weight Loss > 10% of Body Weight
- Minor Symptoms
  - Malaise
  - Fatigue
  - Pruritis
  - Alcohol Intolerance
  - Frequent Infections
- Do Not Code Minor Symptoms as “B” Symptoms

Immune System

- Primary Function Lymphatic System – Fluid Retrieval
- Primary Function Immune System – Protect from infection
  - Bacteria
  - Viruses
  - Fungi
  - Injury
  - Parasites
- Interacts with Nervous System
- Protects via immune response from;
  - Innate Immunity
  - Adaptive Immunity

Source: http://static.abderotec.com/2013images/figure1.jpg

Immune System

- Causes of Lymph Node Enlargement:
  - Non-specific reactive hyperplasia
  - Inflammatory Reaction
    - Foreign Body
    - Tuberculosis
    - Infection
    - Injury
  - Neoplasm
    - Primary – Lymphoma (Hodgkin or Non-Hodgkin)
    - Secondary – Metastatic Ds. via Lymph Node Drainage

Source: http://static.abderotec.com/2013images/figure1.jpg

Hematopoiesis

- What is a hematopoietic stem cell?
- Where are hematopoietic stem cells found?
- Hematopoietic stem cells give rise to ALL blood cells in a process called Cell Line Differentiation
  - Lymphoid cell line (lineage)
  - Myeloid cell line (lineage)
- Cell Line Differentiation
- Cell Line Proliferation
- Regulating Proliferation and Differentiation
Regulatory Function of Cells

- Regulation of proliferation
- Regulation of differentiation
- Turn on/Turn off
  - Growth factors
  - Genes (including mutations)
  - Proteins
- Disregulation disrupts normal development of cell line
- Ongogenesis – becoming malignant

Cell Line Differentiation

- Cellular differentiation is the process by which an immature cell becomes a more mature cell
- Differentiation changes a cell's size, shape, membrane potential, metabolic activity, and responsiveness to signals or signal pathways
- Regulatory function of cells (regulates cell line proliferation and cell line differentiation) so you have right mix of different types of hematopoietic cells being produced by the bone marrow...and circulating in the blood and/or lymph.
- Over/Under Production by bone marrow of one cell line (clonal)
- Too many or too few cells may lead to chronic/acute condition

T-cell Differentiation

B-cell Differentiation

Differentiation and Immune Function

Classification of Lymphoid Neoplasms

- Development of a World Standard
  - 1951 – Dameshek – clinical phenotype
  - 1960 – Philadelphia (Ph1) chromosome
  - 1966 – Rappaport Classification
  - 1974 – Kiel Classification System
  - 1974 – Lukes and Collins System
  - 1976 – Revised Rappaport Classification
  - 1976 – French – American – British Classification

Classification of Lymphoid Neoplasms

- Development of a World Standard
  - 1982 – Working Formulation
  - 1994 – Revised European-American Classification of Lymphoid Neoplasms
2008 WHO Classification of Lymphoid Neoplasms

Incorporates:
- Histology/Morphology
- Stage of Differentiation
- Immunophenotype
- Genotypic features
- Clinical features

2008 WHO Classification - Lymphoid

- Precursor Lymphoid Neoplasm
- Mature B-Cell Neoplasm
- Mature T-Cell and NK-Cell Neoplasm
- Hodgkin Lymphoma
- Histiocytic/Dendritic Cell Neoplasm
- PTLD (Post-Transplant)

Understanding Complex Disease Processes

- Lymph Node Biopsy
- Extranodal Site Biopsy
- Diagnostic Imaging (CT/PET/MRI)
- Bone Marrow Aspirate
- Bone Marrow Biopsy

- Histology/Morphology
- Immunohistocytotoxicity
- Flow Cytometry (Immunophenotype)
- Cytogenetics
- Molecular Genetic Studies
  - FISH
  - PCR

The Clinical Workup

- Disease Definition
- Risk Factors
- Signs and Symptoms
- Diagnostic Work Up
  - Clinical Evaluation
  - History and Physical
  - CBC – What is Normal
  - Immunophenotype
  - Imaging Studies (CT/PET/MRI and PET/CT)
  - Tissue Biopsy – Histologic Type and Staining
  - Bone Marrow Biopsy – Histologic Type and Staining
  - Molecular Cytogenetics – Genetic Testing
Disease Definition

### Table 2
Diagnostic criteria for plasma cell myeloma

<table>
<thead>
<tr>
<th>Symptomatic plasma cell myeloma</th>
<th>Asymptomatic (smoldering) myeloma</th>
</tr>
</thead>
<tbody>
<tr>
<td>M-protein in serum or urine.</td>
<td>M-protein in serum at myeloma levels (&gt;30 g/L) and/or ≥ 10% clonal plasma cells in BM</td>
</tr>
<tr>
<td>BM clonal plasma cells or plasmacytoma.</td>
<td>No related organ or tissue impairment end-organ damage or bone lesions (CRAB) or myeloma-related symptoms</td>
</tr>
<tr>
<td>Related organ or tissue impairment heavy chain disease (CRAB)</td>
<td></td>
</tr>
</tbody>
</table>

Dx Confirmation - Codes

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Positive history</td>
<td>Abnormal findings from microscopic examination of bone marrow aspirate/slide or fine needle aspiration biopsy.</td>
</tr>
<tr>
<td>2</td>
<td>Negative history</td>
<td>Lack of abnormalities from microscopic examination of bone marrow aspirate/slide or fine needle aspiration biopsy.</td>
</tr>
<tr>
<td>3</td>
<td>Biopsy positive</td>
<td>Positive microscopic diagnosis of primary tumor mass.</td>
</tr>
<tr>
<td>4</td>
<td>Biopsy negative</td>
<td>Negative microscopic diagnosis of primary tumor mass.</td>
</tr>
</tbody>
</table>

Dx Confirmation - Instructions

1. There is no specific hierarchy for coding Diagnostic Confirmation for hematopoietic and lymphoid tumors. Most commonly, specific histologic type is diagnosed via immunophenotyping or genetic testing. Once the hematopoietic/lymphoid (H/L) subcategory is specified, use the definitive diagnostic confirmation codes for specific types of tumors.
2. Code 1 when the microscopic diagnosis is based on tissue specimens from biopsy, bone marrow, or aspirate. Code 2 is used when there is no microscopic diagnosis of the original tumor mass. Code 4 is used when there is no microscopic diagnosis of the definitive diagnosis.
3. For leukemias only, code 1 when the diagnosis is based only on the complete blood count (CBC), white blood cell (WBC) or peripheral blood smear. Code 2 is used if the diagnosis is based on immunophenotyping or genetic testing, or both. Code 2 is used for lymphomas and myelomas.
4. Code 1 when the microscopic diagnosis is based on clinical evaluation of cells (either by flow cytometry or microscopic examination). Code 1 is used when the microscopic diagnosis is based on clinical evaluation of cells (either by flow cytometry or microscopic examination).
5. Code 2 when there is a histologic diagnosis of lymphoma and/or positive immunophenotyping and/or positive genetic testing results. Do not use code 2 for lymphomas diagnosed prior to January 1, 2010.

Disease Progression

- The worsening of a disease over time
- Advancing stage of disease with/out treatment
- Progression from a solitary site of involvement to multiple sites of involvement.
- May be used to describe the progression of a chronic state of disease to an acute state.

Hematopoietic Disease Progression

- **Same**
  - Cell type
  - "Function"
  - Genetics
- **Change**
  - Symptoms
  - Treatment Approach
  - Prognosis or Life Expectancy

Source: www.haematologica.org
Transformation

- Change in nature, function, or condition of cells
- Change in cell’s potential or type; cell undergoing genetic transformation
- Most transformations are myeloid neoplasms transforming from chronic myeloproliferative or myelodysplastic disease into acute myeloid leukemia
- Chronic Lymphocytic Leukemia (CLL) to Acute Lymphoblastic Leukemia (ALL) is rare - new primary

Hematopoietic Disease Transformation

- Rare in Lymphoid Neoplasms
- Different
  - Cell type
  - “Function”
  - Genetics
- Change
  - Symptoms
  - Treatment Approach
  - Prognosis or Life Expectancy

Source: www.haematologica.org

Cutaneous Lymphomas

- Most primary skin lymphomas are T-cell lymphoma
  - Often multiple skin sites involved - plaque
  - Mycosis Fungoides
  - Sezary Syndrome
- Primary B-cell lymphoma of skin is rare
  - Cutaneous Follicle Center Lymphoma
  - Cutaneous Marginal Zone B-cell lymphoma
  - Cutaneous Diffuse Large B-cell lymphoma
- Diffuse Large B-cell lymphoma of skin is very rare

2014 Rule Updates 2014

- Only 1 Format – TEXT
- All Changes to Rules are Effective for Cases Dx 2010>
  - Some Rules Combined
  - Duplicate Rules Removed
  - Corrections to Some Rules
  - Clarifications to Some Rules
  - Example: Review of 2010 and 2011 data shows multiple occurrences of patients with multiple MDS histologies (9980/3, 9982/3, 9983/3, 9984/3, 9985/3, 9986/3, 9989/3, 9991/3, 9992/3)
- Improved (embedded) Navigation to Related Rules
  - Example: See Module 5, PH9 and PH10 for information regarding primary site and histology

2014 Rule Updates 2014

- PH Rules Reduced from 43 to 31
- Primary Site Coding Rules for Lymphoma are More Clear
- Lymphoid Combinations Clarified
  - DLBCL with any other lymphoma coded to DLBCL
  - Other mixed lymphomas handled differently
- OBS (obsolete) codes
  - All OBS codes are obsolete as of 1/1/2010
  - OBS codes are now date driven
  - Instruction to use for ”DCO’s, path only and minimal information” cases removed
How to Use and Follow the Rules

Rules Basics
1. Is the condition reportable?
2. How many cases do I abstract?
3. How do I code the primary site?
4. How do I code the histology?
5. How do I code the grade?

Determining Primary Site

Primary Site and Histology Coding Rules

1. Is the condition reportable?
2. How many cases do I abstract?
3. How do I code the primary site?
4. How do I code the histology?
5. How do I code the grade?
Single Node Station/Multiple LN/Extranodal

- Biopsy Site
- Single Node Station
- Bilateral - Same Node Station?
- Multiple Node Stations
- No nodal involvement

Number of Involved Nodal Areas

Source: NCCN.org and Dana-Farber Cancer Institute, Inc.

Determining Histologic Type

- Code the non-specific (NOS) histology when – PH28
- Code the specific histology when – PH29
- Use the Heme Data Base in Most Cases – PH30
- Code the Numerically Higher – PH31

</table>

Note 1: Osseous plasmacytomas are localized tumors occurring in the bone. There may be soft tissue extension.

Note 2: Extraosseous (extramedullary) plasmacytomas are plasma cell neoplasms that arise in tissues other than bone. The most common sites are the upper respiratory tract, the gastrointestinal tract, lymph nodes, bladder, central nervous system (CNS), breast, thyroid, testis and skin.

MyelomaPlasmaCellDisorder Schema

- Note 3: Criteria for the diagnosis of multiple myeloma include: presence of clonal bone marrow plasma cells or plasmacytoma, presence of an M-protein in serum and/or urine, and the presence of related organ or tissue impairment. Do not use this criteria to determine the diagnosis of multiple myeloma. Code according to histologic confirmation or physician statement according to the AJCC 7th edition.

- Note 4: Multiple myeloma or plasma cell myeloma is a widely disseminated plasma cell neoplasm, characterized by a single clone of plasma cells derived from B cells that grows in the bone marrow. It is always coded to 810 or 820 for systemic involvement.

Site Specific Factors - Lymphoma

- SSF1 – Associated with HIV/AIDS
- SSF2 – Systemic Symptoms at Diagnosis
- SSF3 – International Prognostic Index (IPI)
- SSF4 – Follicular Lymphoma Prognostic Index (FLIPI)
- SSF5 – International Prognostic Score (IPS)
Site Specific Factors – Plasma Cell Tumors

- SSF1 – OBSOLETE
- SSF2 – Durie-Salmon Staging System
- SSF3 – Multiple Myeloma Terminology

Treatment Options – Lymphoid Neoplasms

- Hodgkin Lymphoma
- Non-Hodgkin Lymphoma
- Chronic Lymphocytic Leukemia
- Acute Lymphocytic Leukemia
- Other Lymphoid Neoplasm

Treatment Options – Basic Concepts

- Surgery
- Chemotherapy
- Radiation Therapy
- Hormonal Therapy
- Combination Therapy
- Continuation Therapy
- Bone Marrow/Stem Cell Transplant

Pre-Induction Risk Assessment
- Induction Therapy
- Post-Induction Assessment
- Re-Induction Therapy
- Intensification/Consolidation Therapy
- Post-Consolidation Assessment
- BMT/Stem Cell Transplant
- Maintenance Therapy
- Maintenance Assessment

Risk-Based Treatment – Pre-Induction Risk
- Patient Characteristics
  - Performance Status
  - Age at Diagnosis
  - Comorbidities
  - B-Symptoms
- Neoplasm Characteristics
  - Morphology
  - Immunophenotype
  - Stage of Differentiation
  - Molecular/Cyto-Genetics
- Special Characteristics of Neoplasm or Patient
Treatment Options – Basic Concepts

- Risk-Based Treatment – Induction Failure
  - Identify patients at highest risk of induction failure:
    - T-cell phenotype (especially without a mediastinal mass)
    - B-precursor ALL with very high presenting leukocyte counts
    - Bulky Disease
- Risk-Based Treatment – Re-Induction/Consolidation
  - Re-Induction
  - Intensification
  - Consolidation
- Risk-Based Treatment – Sanctuary Sites
- Risk-Based Treatment – Maintenance Therapy

Source: http://cancer.gov – Pediatric Lymphoid Neoplasm NCI PDQ for Health Professionals

Treatment Options – Basic Concepts

- Risk-Based Treatment Assessment Examples
  - Low Risk Disease – Stage I, II – no B symptoms, no bulky disease
  - Intermediate Risk Disease – Stage I, II with B symptoms
  - Intermediate Risk Disease – Stage I, II with bulky disease
  - Intermediate Risk Disease – Stage IIIA, IVA
  - High Risk Disease – Stage IIIB, IVB
  - High Risk Disease – Poor response to initial chemotherapy

Source: http://cancer.gov – Pediatric Lymphoid Neoplasm NCI PDQ for Health Professionals

Treatment - Surgery

- Surgery – when do you code for lymphoma?
- Surgery – when do you NOT code for lymphoma?
- Why the difference?
- When is Surgery = TX
- Why so seldom?

Treatment - Chemotherapy

- Chemotherapy Regimens
  - REMINDER: Many regimens contain Prednisone which is to be coded under Hormone Therapy – in addition to the combination Chemotherapy
